

Quantum powered shelving technology

Quantum

Quantum is Rackline's new entry level powered mobile shelving system. It combines sleek designer looks with state of the art electronic design, but is also highly cost effective for the customer.

Its attractive operating buttons are black anodized aluminium incorporating piezo electric technology making them touch sensitive. They are mounted in a tinted Perspex panel. The circuitry mounted behind the panel contains LED lights to indicate the direction of the mobiles movement during use and also to give a constant update on the charge of the contained battery unit.

It's simple and safe to use, press and hold to move the carriages at the same time, let go and the movement will stop.

The Quantum is completely cable free as each individual unit is powered by lithium ion batteries simply charged by plugging into a normal 13 amp plug or hard wired into an electrical spur. The batteries will retain power for several weeks if left open and unused. But even under normal use they will run for 5 -7 days without recharging.

The Quantum is also the only powered mobile shelving system in the UK that is safety certified ensuring it will meet all Health and Safety criteria in your business.

Finally the Quantum has been designed to run on the unique Monotrak floor system. This means it can sit directly on a level access carpeted floor avoiding the trip hazards of infill floors and ensuring décor through the office remains consistent.
